GPS & GSM based Tracker Workshop

GPS and GSM based Tracking systems are useful in providing exact location of any device they are attached to. In this workshop you can build a GPS and GSM based Tracker using Arduino which can send continuous updates about the position on Google maps in your mobile phone or computer.

- **Build your own GPS and GSM based tracker**
- **Work with GPS modules, antenna and GSM modules**
- **Develop the project using Arduino development board**
- **Implement Arduino programming for functioning of project**
- **Set up live maps as part of tracking system**
